1 Getting Help

Moneris has help for you at every stage of the integration process.

Getting Started	During Development	Production
Contact our Client Integration Specialists: clientintegrations@moneris.com Hours: Monday – Friday, 8:30am to 8 pm ET	If you are already working with an integration specialist and need technical development assistance, contact our eProducts Technical Consultants: 1-866-319-7450 eproducts@moneris.com Hours: 8am to 8pm EST	If your application is already live and you need production support, contact Moneris Customer Service: onlinepayments@moneris.com 1-866-319-7450 Available 24/7

For additional support resources, you can also make use of our community forums at http://community.moneris.com/product-forums/

2 About Credential on File

When storing customers' credit card credentials for use in future authorizations, or when using these credentials in subsequent transactions, card brands now require merchants to indicate this in the transaction request.

In the Moneris API, this is handled by the Moneris Gateway via the inclusion of the Credential on File object and its variables in the transaction request.

While the requirements for handling Credential on File transactions relate to Visa and Mastercard only, in order to avoid confusion and prevent error, please implement these changes for all card types and the Moneris system will then correctly flow the relevant card data values as appropriate.

NOTE: If either the first transaction or a Card Verification authorization is declined when attempting to store cardholder credentials, those credentials cannot be considered stored — therefore the merchant must not use the credential for any subsequent transactions.

April 2018 Page 4 of 54

3 Credential on File Object and Variables

The Credential on File object is nested within the request for the applicable transaction types.

Object:

cof

Variables in the cof object:

Payment Indicator Payment Information Issuer ID

For more information, see Definition of Request Fields – Credential on File.

April 2018 Page 5 of 54

4 Credential on File Transaction Types

The Credential on File object applies to the following transaction types:

- Purchase
- Pre-Authorization
- Purchase with Vault ResPurchaseCC
- Pre-Authorization with Vault ResPreauthCC
- Card Verification with AVS and CVD
- Card Verification with Vault ResCardVerificationCC
- Vault Add Credit Card ResAddCC
- Vault Update Credit Card ResUpdateCC
- Vault Add Token ResAddToken
- Recurring Billing transactions (except when updating)

NOTE: For the following transactions, the Credential on File object also applies, but Moneris sends the indicated fields on your behalf:

• Re-Authorization

4.1 Purchase

Purchase transaction object definition

```
Purchase purchase = new Purchase();
```

HttpsPostRequest object for Purchase transaction

```
HttpsPostRequest mpgReq = new HttpsPostRequest();
mpgReq.setTransaction(purchase);
```

April 2018 Page 6 of 54

Purchase transaction values

Table 1: Purchase transaction object mandatory values

Value	Туре	Limits	Set method
Order ID	String	50-character alpha- numeric	<pre>purchase.setOrderId(order_id);</pre>
Amount	String	9-character decimal	<pre>purchase.setAmount(amount);</pre>
Credit card number	String	20-character alpha- numeric	<pre>purchase.setPan(pan);</pre>
Expiry date	String	4-character alpha- numeric (YYMM format)	<pre>purchase.setExpDate(expiry_ date);</pre>
E-commerce indic- ator	String	1-character alpha- numeric	<pre>purchase.setCryptType(crypt);</pre>

Table 2: Purchase transaction object optional values

Value	Туре	Limits	Set method
Status Check	Boolean	true/false	<pre>mpgReq.setStatusCheck (status_check);</pre>
Customer information	Object	N/A	<pre>purchase.setCustInfo(cus- tomer);</pre>
AVS	Object	N/A	<pre>purchase.setAvsInfo (avsCheck);</pre>
NOTE: When storing credentials, the CVD object must be sent; for subsequent transactions using stored credentials, CVD can be sent with cardholder-initiated transactions only.	Object	N/A	<pre>purchase.setCvdInfo (cvdCheck);</pre>
Convenience fee	Object	N/A	purchase.setConvenienceFee

Page 7 of 54 April 2018

Table 2: Purchase transaction object optional values

Table 2. Fulchase transaction object optional values				
Value	Туре	Limits	Set method	
NOTE: This variable does not apply to Credential on File transactions.			<pre>(convFeeInfo);</pre>	
Recurring billing	Object	N/A	<pre>purchase.setRecurInfo (recurInfo);</pre>	
Dynamic descriptor	String	20-character alpha- numeric	<pre>purchase.setDy- namicDescriptor(dynamic_ descriptor);</pre>	
NOTE: For basic Purchase and Preauthorization, the wallet indicator applies to Visa Checkout and MasterCard MasterPass only. For more, see Appendix A Definition of Request Fields.	String	3-character alpha- numeric	<pre>purchase.setWalletIndicator (wallet_indicator);</pre>	
Credential on File Info cof NOTE: This is a nested object within the transaction, and required when storing or using the customer's stored credentials. The Credential on File Info object has its own request variables, listed in blue in the table below, "Credential on File Object Request Variables".	Object	N/A	<pre>purchase.setCofInfo(cof);</pre>

April 2018 Page 24 of 54

4.5 Card Verification and Credential on File Transactions

NOTE: The following information applies to Visa, Mastercard and Discover transactions

In certain cases, some Credential on File transactions require the prior use of a Card Verification transaction.

In the absence of a Purchase or Pre-Authorization, the Card Verification with AVS and CVD transaction is used to get the unique Issuer ID value that is used in subsequent Credential on File transactions. Issuer ID is a variable included in the nested Credential on File object. For a complete list of these variables, see each transaction type or Definition of Request Fields - Credential on File

The Card Verification request, including the Credential on File object, must be sent immediately prior to sending the transactions in these scenarios.

4.5.1 When to Use Card Verification With COF

If you are not sending a Purchase or Pre-Authorization transaction (i.e., you are not charging the customer immediately), you must use Card Verification (or in the case of Vault Add Token, Card Verification with Vault) first before running the transaction in order to get the Issuer ID.

Transactions this applies to:

Vault Add Credit Card Vault Update Credit Card Vault Add Token Recurring Billing transaction (first in series), if: · the first transaction does not begin immediately

4.5.1.1 Credential on File and Vault Add Credit Card

For Vault Add Credit Card transactions:

- 1. Send Card Verification transaction request including the Credential on File object to get the
- 2. Send the Vault Add Credit Card request including the Credential on File object

Vault Add Credit Card – ResAddCC

ResAddCC transaction object definition

Sample Vault Add Credit Card

```
catch (Exception e)
{
e.printStackTrace();
}
}
```

4.5.1.2 Credential on File and Vault Update Credit Card

For Vault Update Credit Card transactions:

- Send Card Verification transaction request including the Credential on File object to get the Issuer ID
- 2. Send the Vault Update Credit Card request including the Credential on File object

Vault Update Credit Card – ResUpdateCC

Things to Consider:

- Updates a Vault profile (based on the data key) to contain credit card information. All
 information contained within a credit card profile is updated as indicated by the submitted fields.
- This will update a profile to contain Credit Card information by referencing the profile's
 unique data_key. If the profile which is being updated was already a Credit Card profile,
 all information contained within it will simply be updated as indicated by the submitted
 fields. This means that all fields are optional, and only those fields that are submitted
 will be updated.
- To update a specific field on the profile, only set that specific element using the corresponding set method.

Vault Update Credit Card transaction object definition

```
ResUpdateCC resUpdateCC = new ResUpdateCC();
```

HttpsPostRequest object for Vault Update Credit Card transaction

```
HttpsPostRequest mpgReq = new HttpsPostRequest();
mpgReq.setTransaction(resUpdateCC);
```

April 2018 Page 30 of 54

Vault Update Credit Card transaction values

Table 11: Vault Update Credit Card transaction object mandatory values

Value	Туре	Limits	Set method
Data key	String	25-character alpha- numeric	<pre>resUpdateCC.setData(data_ key);</pre>

Optional values that are submitted to the ResUpdateCC object are updated. Unsubmitted optional values (with one exception) remain unchanged. This allows you to change only the fields you want.

The exception is that if you are making changes to the payment type, **all** of the variables in the optional values table below must be submitted.

If you update a profile to a different payment type, it is automatically deactivated and a new credit card profile is created and assigned to the data key. The only values from the prior profile that will remain unchanged are the customer ID, phone number, email address, and note.

EXAMPLE: If a profile contains AVS information, but a ResUpdateCC transaction is submitted without an AVSInfo object, the existing AVSInfo details are deactivated and the new credit card information is registered without AVS.

e.printStackTrace(); } } }

4.5.1.4 Credential on File and Recurring Billing

NOTE: Updating Recurring Billing transactions (using the UpdateRecur object) is not currently permitted with Credential on File.

For Recurring Billing transactions which are set to start **immediately**:

• Send a Purchase transaction request with both the Recur and Credential on File objects.

For Recurring Billing transactions which are set to start on a **future** date:

- Send Card Verification transaction request including the Credential on File object to get the Issuer ID
- 2. Send Purchase transaction request with the Recur and Credential on File objects included

For more information about the Recur object, see Definition of Request Fields – Recurring.

4.5.2 Card Verification with AVS and CVD

Things to Consider:

- The Card Verification transaction is only supported by Visa, MasterCard and Discover
- For some Credential on File transactions, Card Verification is used as a prior step to get the Issuer ID used in the subsequent transaction
- This transaction is also known as an "account status inquiry"

Card Verification object definition

```
CardVerification cardVerification = new CardVerification();
```

HttpsPostRequest object for Card Verification transaction

```
HttpsPostRequest mpgReq = new HttpsPostRequest();
mpgReq.setTransaction(cardVerification);
```

Credential on File Transaction Object Request Variables

Value	Туре	Limits	Set Method
NOTE: This variable is required for all merchant-intiated transactions following the first one; upon sending the first transaction, the Issuer ID value is received in the transaction response and then used in subsequent transaction requests (Issuer ID does not apply for Discover or Union Pay).	String	15-character numeric variable length	cof.setIssuerId("VALUE_FOR_ISSUER_ID"); NOTE: For a list and explanation of the possible values to send for this variable, see Definition of Request Fields – Credential on File
Payment Indicator	String	1-character alphabetic	cof.setPaymentIndicator ("PAYMENT_INDICATOR_VALUE"); NOTE: For a list and explanation of the possible values to send for this variable, see Definition of Request Fields – Credential on File
Payment Inform- ation	String	1-character numeric	cof.setPaymentInformation ("PAYMENT_INFO_VALUE"); NOTE: For a list and explanation of the possible values to send for this variable, see Definition of Request Fields - Credential on File

Sample Card Verification

```
package Canada;
import JavaAPI.*;
public class TestCanadaCardVerification
public static void main(String[] args)
String store id = "store5";
String api_token = "yesguy";
java.util.Date createDate = new java.util.Date();
String order_id = "Test"+createDate.getTime();
String pan = "4242424242424242";
String expdate = "1901"; //YYMM format
String crypt = "7";
```

4.5.3 Card Verification with Vault – ResCardVerificationCC

Things to Consider:

- This transaction type only applies to Visa, MasterCard and Discover transactions
- This transaction is also known as an "account status inquiry"
- The card number and expiry date for this transaction are passed using a token, as represented by the data key value
- For Credential on File transactions, this is **not** used as a prior step to get the Issuer ID

Card Verification object definition

ResCardVerificationCC resCardVerificationCC = new ResCardVerificationCC();

HttpsPostRequest object for Card Verification transaction

HttpsPostRequest mpgReq = new HttpsPostRequest();
mpgReq.setTransaction(resCardVerificationCC);

Card Verification transaction values

Table 17: Card Verification with Vault transaction object mandatory values

Value	Туре	Limits	Set method
Order ID	String	50-character alpha- numeric	<pre>resCardVerificationCC .setOrderId(order_id);</pre>
Data key	String	25-character alpha- numeric	<pre>resCardVerificationCC .setDataKeyFormat(data_key_ format);</pre>
E-commerce indicator	String	1-character alpha- numeric	<pre>resCardVerificationCC .setCryptType(crypt);</pre>

April 2018 Page 44 of 54

Table 17: Card Verification with Vault transaction object mandatory values

Value	Туре	Limits	Set method
AVS	Object	N/A	<pre>resCardVerificationCC .setAvsInfo(avsCheck);</pre>
CVD	Object	N/A	<pre>resCardVerificationCC .setCvdInfo(cvdCheck);</pre>
Credential on File Info cof NOTE: This is a nested object within the transaction, and required when storing or using the customer's stored credentials. The Credential on File Info object has its own request variables, listed in blue in the table below, "Credential on File Object Request Variables".	Object	N/A	<pre>resCardVerificationCC .setCofInfo(cof);</pre>

Appendix A Definition of Request Fields – Credential on File

Value	Туре	Limits	Description
Issuer ID	String	String 15-character numeric variable length	Unique identifier for the cardholder's stored credentials
NOTE: This variable is required for all mer-chant-intiated transactions following the			Sent back in the response from the card brand when processing a transaction
first one; upon sending the first transaction, the Issuer ID value is received in the transaction response and then used in subsequent transaction requests (Issuer ID does not apply for Discover or Union Pay).			If the cardholder's credentials are being stored for the first time, you must save the Issuer ID on your system to use in subsequent Credential on File transactions
Payment Indicator	String	1-character alphabetic	Indicates the intended or current use of the credentials
			Possible values for first transactions:
			C - unscheduled credential on file (first transaction only)
			R - recurring
			Possible values for subsequent transactions:
			R - recurring
			U - unscheduled merchant-initiated trans- action
			Z - unscheduled cardholder-initiated trans- action
Payment Information	String	1-character numeric	Describes whether the transaction is the first or subsequent in the series
			Possible values are:
			0 - first transaction in a series (storing payment details provided by the cardholder)

April 2018 Page 49 of 54

Value	Туре	Limits	Description
			2 - subsequent transactions (using previously stored payment details)

Page 50 of 54 April 2018

Appendix B Definition of Request Fields – Recurring

Value	Туре	Size	Description
Number of Recurs num_recurs	String	numeric	The number of times that the transaction must recur
Period period	String	numeric	Number of recur units that must pass between recurring billings
Start Date start_date	String	YYYY/MM/DD	Date of the first future recurring billing transaction This value must be a date in the future If an additional charge is to be made immediately, the value of Start Now must be set to true

April 2018 Page 51 of 54

Value	Туре	Size	Description
Start Now start_now	String	true/false	If a single charge is to be made against the card immediately, set this value to true; the amount to be billed immediately may differ from the amount billed on a regular basis thereafter
			If the billing is to start in the future, set this value to false
			When set to false, use Card Veri- fication prior to sending the Purchase with Recur and Credential on File objects
Recurring Amount	String	9-character decimal	Amount of the recurring transaction
recur_amount		Minimum three digits, two of which are penny values	This is the amount that will be billed on the Start Date and then billed repeatedly based on the interval defined by Period and Recur Unit
Recur Unit	String	alphabetic	Unit to be used as a basis for the interval
recur_unit			Works in conjunction with Period to define the billing frequency
			Possible values are:
			day
			week
			month
			eom (end of month)

Page 52 of 54 April 2018

Appendix C Definition of Response Fields – Credential on File

Value	Туре	Size	Get Method / Description
Issuer ID	String	15-character alpha- numeric	Returned when processing a transaction where the cardholder's credentials are being stored for the first time, and is used as the value for Issuer ID in the requests for subsequent transactions NOTE: For Discover and Union Pay transactions, Issuer ID is not returned in the response
